Annu Rev. Immunol. 15:481-504 (1997).

C -!- FUNCTION: Mediates B-cell bin lymphoid tissues. Binds sialylated the localization of B-cells in Lymphoid tissues. Binds sialylated glycoproteins; one of which is CD45. Preferentially binds to alpha2,6-linked sialic acid. The sialic acid recognition site can be masked by cis interactions with sialic acids on the same cell surface. Upon ligand induced trosine phosphorylation in the immune response seems to be involved in regulation of B cell antigen receptor signaling. Plays a role in positive regulation through interaction with Src family tyrosine kinases and may also act as an inhibitory receptor by recruiting cytoplasmic phosphatases via their SH2 domains that block signal transduction through dephosphorylation of signaling molecules.

-!- SUBUNIT: Predominantly monomer of isoform CD22-beta. Also found as heterodimer of isoform CD22-beta and a shorter isoform. Interacts with PTPN6/SHP-1, LYN, SYK, PIKNRI/PIKNR2 and PLCG1 upon phosphorylation. Interacts with GRB2, INPSD and SHC1.

C phosphorylation (By similarity). May form a complex with INPSD/JSHIP, GRB2 and SHC1.

C INPSD/JSHIP, GRB2 and SHC1.

C FUNCTION: Type I membrane protein.

C FUNCTION: Type I membrane protein.

IsoId=P20273-2; Sequence=VSP 002531;
TISSUE SPECIFICITY: B lymphocytes.
DOWAIN: Contains 4 copies of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular responses. The phosphorylated ITIM motif binds to the SH2 domain of PTPM6/SHP-1.
PTM: Phosphorylated both on threonine/serine and tyrosine

It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells. SUBUNIT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       membrane components such as laminin, prolargin and collagen

D 52:369-379(1996).

EUNCTION: IMPORTANT IN CELL-CELL RECOGNITION. APPEARS TO FUNCTION IN LEUKOCYTE-ENDOTHELIAL CELL ADHESION. INTERACTS WITH THE BETA-1 INTEGRIN VLA4 ON LEUKOCYTES, AND MEDIATES BOTH ADHESION AND SIGNAL TRANSDUCTION. THE VCAM1/VLA4 INTERACTION MAY PLAY A PATHOPHYSIOLOGIC ROLLS BOTH IN IMMUNE RESPONSES AND IN LEUKOCYTE EMIGRATION TO SITES OF INFLAWMATION.

SUBCELLULAR LOCATION: Type I membrane protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Cell adhesion molecule with an important role in the development of the nervous system. Involved in neuron-neuron adhesion, neurite fasciculation, outgrowth of neurites, etc. Binds to exonin on neurons (By similarity).

SUBCELCULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed in postmitotic neurones in 16-36 hour embryos, including those in the brain, cranial ganglia and
                                                                                                                                                                                                                                                                                                                                                         initiation of axonogenesis in 16-36 hour embryos.
SIMILARITY: Belongs to the immunoglobulin superfamily.
Ll/neurofascin/NgCAM family.
SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 5 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                        DEVELOPMENTAL STAGE: Onset of expression correlates with initiation of axonogenesis in 16-36 hour embryos.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       otic and olfactory placodes, and in all classes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mol.
                                                                                                                                                                                                                                                                                                                                                                                                                              found in proteins SH, X, and NIG-64. The Kern protein has the Kern+ marker, the NEWM protein has the Oz+ marker, the Mcg protein has the Kern+ marker, and the Mcg+ marker and the Mcg+ marker.

MISCELLANEOUS: Six tandem lambda-type genes were identified and the 3 most 5' were sequenced. These correspond to the Mcg sequenced. These correspond to the Mcg sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY: Contains 1 immunoglobulin-like domain.

J. Immunol. 167:2547-2554(2001).

-i- FUNCTION: Immunoglobulin-like cell surface receptor for CD47. Acts as docking protein and induces translocation of PTPN6, PTPN11 and other binding partners from the cycosol to the plasma membrane. Supports adhesion of cerebellar neurons, neurite outgrowth and glial cell attachment. May play a key role in intracellular signaling during synaptogenesis and in synaptic function (By similarity). Involved in the negative regulation of receptor tyrosine kinase-coupled cellular responses induced by cell adhesion, growth factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cell activation. CD47 binding prevents maturation of immature dendritic cells and inhibits cytokine production by mature dendritic cells.

-I- SUBUNIT: Binds PTPN11 when tyrosine-phosphorylated, except in macrophages, where it primarily binds PTPN6. Binds GRB2 in vitro. Binds FGR (By similarity). Binds JAK2 irrespective of its phosphorylation status and forms a stable complex. Binds SCAP1 and/or SCAP2. The resulting complex recruits FYB. Binds PTKZB.

-I- ALTERNATIVE PRODUCTS:

Eventella resulting complex recruits FYB. Binds PTKZB.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: Attached to the membrane by a GPI TISSUE SPECIFICITY: Found in adenocarcinomas of endoder derived digestive system epithelium and fetal colon. PTM: COMPLEX IMMUNOREACTIVE GLYCOPROTEIN WITH A MM OF 1 COMPRISING 60% CARBOHYDRATE.
SIMILARITY: Belongs to the immunoglobulin superfamily. SIMILARITY: Contains 7 immunoglobulin-like domains. DATABASE: NAME-PROW; NOTE-CD guide CD66e entry; WWW-"http://www.ncbi.nlm.nih.gov/prow/cd/cd66e.htm".

"Organization of the neurofascin gene and analysis of developmenta regulated alternative splicing.";

J. Biol. Chem. 272:28742-28749 [1997).
-!- FUNCTION: Cell adhesion, ankyrin-binding protein which may be involved in neurite extension, axonal guidance, synaptogenesis myelination and neuron-glial cell interactions (By similarity)
-!- SUBCELIULAR LOCATION: Type I membrane protein.
-!- ALTERNATIVE PRODUCTS:
Event-Alternative splicing; Named isoforms=2;
Comment-A number of isoforms are produced;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DISULFID

DEVELOPMENTAL STAGE: There is one major 'early' isoform and multiple 'late' isoforms. Around 50 isoforms are found at different developmental stages.

PTM: N-glycosylated and O-glycosylated.

PTM: May be proteolytically cleaved at Arg-636.

SIMILARITY: Belongs to the immunoglobulin superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               389
